Continuation of 11, does NOT place the application in condition for allowance because: The applicant has traversed the withdrawal of Claims 19-26 on the ground(s) that Claim 19 recites the same inventive feature as Claim 10. However the invention of claim 10 and claim 18 lack unity of invention because their common feature does not provide a contribution over prior art. As the final rejection outlines, thermoelectric modules in contact with both a respective one of the fuel cells and an internal duct between the cells and comprising a cold sink is known. Therefore the requirement is still deemed proper.

Regarding claim 10, the combination of Reiser in view of JP '272 does teach generating electricity using thermoelectric modules in contact with fuel cells and an internal cooling duct formed between the cells. As outlined in the final rejection, the high temperature exhaust gas of a fuel cell taught by JP '272 are arranged in plates and act as the heat source for the thermoelectric modules. The plate taught by JP '272 is analogous to the heated separator plate taught by Reiser. It is well known in the art that thermoelectric modules use the temperature difference from a heat source and cooling sink in order to produce electricity. Therefore, it would have been obvious to one of ordinary skill in the art that the thermoelectric module taught by Reiser could be in contact with the heated separator plate taught by Reiser so that it could contact the cooling ducks as well.
